/clone lib="CUGI Rice BAC Library"

/clone libe "CUGI Rice BAC Library"

/clone library specific library source of two most popular grains in the world. Half of the world population especially those inhabiting highly populated areas of the humid tropics and subtropics, rely on rice as their primary source of carbohydrate. Monococyledonous rice is a diploid plant (2n=24) with a haploid genome equivalent of 431 Mbp (Arumuganathan and Earle, 1991). The relatively small genome of rice, three times larger than that of genome of rice, three times larger than that of genome sequencing of rice, we have constructed a BAC library contains 36,864 clones with an average insert size of 128.5 Kb providing 10.9 haploid genome equivalents. The deep coverage allows the isolation a particular sequence with a probability of 99.9 %. Two high density filters, each containing 18,432 clones (doubly spotted), represent the whole library for colony screening."

Library was size fractionated on agarose gels (for insert size >400bp) and non-directionally cloned into EcoRI-digested pUC19 vector. Blue/white selection on carbenicillin-containing plates was used to recover positive clones."

Comparison of starch-branching enzyme genes reveals evolutionary

relationships among isoforms. Characterization of a gene for

relationships among isoforms. The wheat genome donor Aegilops

starch-branching enzyme IIa from the wheat genome donor Aegilops

The invention relates to a novel enzyme of starch biosynthetic pathway in a cereal plant, where the enzyme is selected from starch branching enzyme (SBB) I, starch soluble synthase (SSS) I, and debranching enzyme (DBB), with the proviso that the enzyme is not SSS I of rice, or SBE I of

Claim 8; Page 75-81; 171pp; English.

New isolated cereal plant enzyme genes used for, antisense sequences of granule bound synthase.

e.g. expression

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                rice or maize. The methods and products can be used for targeting expression specifically to the endosperm of the seeds of cereal plants such as wheat or barley. They can be used for the expression of e.g. antisense sequences of granule-bound synthase (GBSS), SBE II, low mol. wt. glutenin, grain softness protein I, bacterial isoamylase, bacterial glycogen synthase, and wheat high mol. wt. glutenin Bx17. They can be used for modifying the characteristics of starch produced by a plant. The present sequence represents the SBE II gene sequence. (Updated on 17-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 11473 BP; 3096 A; 2263 C; 2423 G;

A. tauschii is likely to be the ancestral D genome donor of wheat. Probes isolated by the probest sequence were used to identify type II starch branching enzymes (SBEs) in wheat, especially BEIIb. The BEIIb nucleic acids may be used to genetically transform cereal plants such as wheat or barley and for altering their nutritional content by modulating the starch biosynthetic pathway to vary

The plant is selected from corn, tomato, banana, canola, cotton, peanut, sorghum, tobacco, sugarbeet, wheat, and rice. The invention may be useful for the improvement of protein, oil, starch, fibre and moisture content of the cereal grains. In addition, carbohydrate levels may be modified to a more desirable level using the present invention. The present sequence is a DNA sequence from wheat which showed homology to rice "grain filling" genes of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/publishedpct_sequences.

The specification also describes subclass SBEII-1 genes, which are thought to have similar functional properties to the maize SBEIID gene. Starch branching enzymes catalyse the formation of the alpha-1, 6 linkages, creating branch points in the growing starch molecule, via hydrolysis of an alpha-1, 4 linkage followed by reattachment of the released alpha-1, 4-glucan chain to the same or another glucosyl chain. SBEII polypeptides can be used to alter the characteristics of a plant, in particular to alter starch so that it has an elevated gelatinisation onset and/or peak temperature. Starch obtained from transgenic plants is useful in the preparation or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          DNA encoding wheat starch branching enzyme II isoforms, useful in altering the characteristics of a plant, especially elevated starch gelatinization onset and/or peak temperature.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 979

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence encodes wheat starch branching enzyme 9, designated BEIIa. The specification describes BEIIb BEIIb is a type II starch branching enzyme (SBE). The BEIIb nucleic acids may be used to genetically transform cereal plants such as wheat or barley and for altering their nutritional content by modulating the starch biosynthetic pathway to vary levels of amylopectin and/or amylose produced in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Nucleic acids encoding wheat starch branching altering the amylose and amylopectin content of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         WPI;

The specification also describes subclass SBEII-2 sequences. The SBEII-1 genes are thought to have similar functional properties to the maize SBEIIb gene. Starch branching enzymes catalyse the formation of the alpha-1,6 linkages, creating branch points in the growing starch molecule, via hydrolysis of an alpha-1,4 linkage followed by reattachment of the released alpha-1,4-glucan chain to the same or another glucosyl chain. SBEII polypeptides can be used to alter the characteristics of a plant, in particular to alter starch so that it has an elevated gelattinisation onset and/or peak temperature. Starch obtained from transgenic plants is useful in the preparation or processing a foodstuff, particularly bakery products
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               DNA encoding wheat starch branching enzyme II isoforms, useful in altering the characteristics of a plant, especially elevated stargelatinization onset and/or peak temperature.

                                                                           The present sequence represents a clone of wheat starch branching enzyme II (SBEII), which is part of a novel subclass of known SBEII genes, designated SBEII-1. The specification also describes subclass SBEII-2 sequences. The SBEII-1 genes are thought to have similar functional properties to the maize SBEIIb gene. Starch branching enzymes catalyse the formation of the alpha-1,6 linkages, creating branch points in the growing starch molecule, via hydrolysis of an alpha-1,4 linkage followed by reattachment of the released alpha-1,4-glucan chain to the same or another glucosyl chain. SBEII polypeptides can be used to alter the characteristics of a plant, in particular to alter starch so that it has an elevated gelatinisation onset and/or peak temporature. Starch obtained from transgenic plants is useful in the preparation or processing a foodstuff, particularly bakery products
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CDS

The present sequence represents the consensus sequence of wheat starch branching enzyme II (SBSII). The specification describes novel subclasses of SBSII designated SBSII-1 and SBSII-2. The SBSII-1 genes are thought to have similar functional properties to the maize SBSIIb gene. Starch branching enzymes catalyse the formation of the alpha-1, 6 linkages, creating branch points in the growing starch molecule, via hydrolysis of an alpha-1,4 linkage followed by reattachment of the released alpha-1,4-glucan chain to the same or another glucosyl chain. SBSII polypeptides can be used to alter the characteristics of a plant, in particular to alter starch so that it has an elevated gelatinisation onset and/or peak temperature. Starch obtained from transgenic plants is useful in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                DNA encoding wheat starch branching enzyme II isoforms, useful in altering the characteristics of a plant, especially elevated starch
